Primary sex determination in most vertebrates results in the development of a single gonad, ovary or testis, from a biopential plane individually, whose developmental fate is controlled by genetic or environmental mechanisms or a combination of both. For example, sex type is determined by sex chromosomes (genetics) in mannals (i.e. XY male in humans) or temperature in alligators (environmental). Regardless of mechanism, the predominant result is the formation of dimorphic individuals, either male or female, which have a testis or ovary, respectively. The Program for Next Week Dur very own Fran Milberg will be our guest speaker and you won't want to miss it!
